

Supp. Figure 3. Altered Neuro2a morphology in cells treated with LCX. Cells were transfected with f-tractin (red) and fixed and stained with DAPI (blue) 48 h later. (Left) DMSO-treated Neuro2a cells show typical morphology irregular shape and intense actin staining at the periphery. (Center) LCX-treated cell shows large lamellipodia (arrows) with centripetal actin organization. (Right) HCX-treated cells resemble DMSO-treated cells with irregular shape and peripheral actin staining. Scale = 25 μ m.
